

Veterinary Compounding

Veterinarians have to deal with unique problems

We help solve these problems for small and large animals.

- **Bad tasting medicine:** We can prepare medicine into easy-to-give flavored dosage forms that animals devour. **We have 37 different flavors so far.** We can find one even the most discerning cat will love!!
- **Small doses:** Commercial available medicines may be available in only one tablet strength. We can compound dosage forms that are just the right size for any animal.
- **Special Eye Drops:** Veterinarians often require medicinal eye drops. Specialized eye drops may not be commercially available. We can compound eye drops in our sterile laboratory to contain exactly the concentrations of medicine required.
- **Commercially Unavailable Medicines:** If a manufacturer no longer makes a medication we can often obtain the pure pharmaceutical powder and ensure your client continues on their prescribed medication regimen. *For example, we can prepare **cisapride** in many different dosage forms.*

We can prepare medications for use in your clinic:

- Phenylpropanolamine
- Cisapride
- Meloxicam
- Methimazole topical gel
- Tylosin
- Amitriptyline topical gel

And many others! Just Ask!

Veterinary Medicine Flavoring

Many commercially available medicines are not flavored for veterinary use. At Ward Drug Pharmacy we can make it much simpler for you to give your pet medicine by creating a customized product that even a finicky cat won't mind taking.

We have many different flavors in our lab and the experience to make a medicine even a fruit bat likes. We have the usual beef, chicken or fish but what about some of our more exotic animal patients. We make flavored medicine such as:

- Green apple for a Marmoset
- Raspberry for an Iguana or a Pigeon
- Malt for a Goat
- Grape for Cockatoo
- Cheese for a Rat
- Banana for a Ferret
- Apple / orange for exotic birds
- Apple for a Fruit Bat
- Strawberry for a Spider Turtle

If your pet won't take its medicine, give us a call and we'll work with you and your veterinarian to come up with a flavor that works. If that fails we may be able to make a topical preparation that you can apply on your pet's skin.
